

Case Study: Streamlining Security with GYTPOL at a Leading US Insurance Company

The Challenge

Our client, a leading US insurance company, faces numerous security challenges. The Chief Information Security Officer (CISO) leads all security initiatives, including Security Architecture, Operations, and Security Engineering. The company sought a way to implement hardening standards aligned with CIS best practices. The announcement of Log4Shell exacerbated the need for a solution that could expedite the discovery and remediation of such issues.

The Solution

GYTPOL was referred to the company by a peer. The product provided concise visibility into deviations from their baseline and offered additional options to mitigate and/or fully remediate the issues. Unlike other tools such as EDR, VA, and Pentesting, GYTPOL provides specific monitoring and remediation at a level most of these tools do not reach. It is also significantly less fragmented than some of the EDR providers.

The Impact

GYTPOL has helped the company's sysadmin and security teams work together to tackle security issues by removing much of the guesswork about the impact of issues and the best way to fix them. The remediation capability of GYTPOL gives the company confidence that it is safe to make changes without disrupting operations. This is possible because GYTPOL allows monitoring and assessing potential impact long before any disruptive blocks are implemented.

The company uses GYTPOL to remediate large issues that have plagued the remediation team for some time.

They are regularly in GYTPOL running reports and understanding the best go-forward strategy possible.

A notable example of GYTPOL's remediation is its response to Log4Shell. GYTPOL provided straightforward and easy-to-implement mitigation that could be deployed across the company's environment, demonstrating the expertise of their research and engineering teams.

Conclusion

The leading US insurance company has found GYTPOL to be an invaluable tool in its security arsenal. With its unique monitoring and remediation capabilities, GYTPOL has helped the company tackle security issues more effectively and efficiently, providing a safer and more secure environment for its operations.
